## Project Step 5 (Portfolio Assignment)

### **URL to the Clearwater Arena Website:**

<http://flip2.engr.oregonstate.edu:4200/>

### **Executive Summary**

This project has been one tough ride, but we managed to finish it. After going through all of the feedback we received throughout this course, here are the most critical changes we made: first, we took out any relationship between the Employees and Artists to avoid any confusion. It is not how real life works and whichever employees would be helping the artists are the ones who are on staff that night. There cannot be more than one show per night either. We then made the artistID entity the same as the other entities that are unique, not NULL, auto\_increment, etc. We decided to rename the entity “Customers” to “Fans” because that type of demographic makes more sense for a concert arena anyway and it’s less confusing. We had to input CASCADE operations between two tables that were dependent on each other. We put ON DELETE CASCADE for the constraint `fk\_Tickets\_Concerts1`, ON UPDATE CASCADE for `fk\_Tickets\_Fans1`, and ON DELETE CASCADE for `fk\_Fans\_Concerts1`. We put in ON DELETE CASCADE for all the foreign keys in the intersection tables as well. We decided to remove “Concerts\_concertID” and all other similar names from the intersection tables and other entities to avoid any further confusion. Then we removed the relationship between Fans and Concerts because Tickets is already an intersection table in between those two entities.

Earlier, we forgot to make artistID, concertID, fanID, ticketID, and employeeID all AUTO\_INCREMENT, so we fixed that. We also updated the website to no longer have any of the IDs be filled out manually, since their values are all automatically generated. We also made all the PKs unique and made certain values in entities NULL that we deemed appropriate to avoid any issues with populating data. We got feedback about not setting up a nullable FK, so we made another table called “Categories” where its categoryID was NULL and set it up as an FK for the “Tickets” table. We then got rid of the “Concerts\_Artists” table and just put artistID as an FK inside of “Concerts” instead because it was much easier and more logical to have only “Concerts\_Employees” as an M:N table instead. Lastly, we finished putting in both UPDATE and DELETE operations for the “Concerts\_Employees” table.

After receiving and carefully going through all our feedback from our classmates, I can confidently say that the design of our project is now much easier to implement. Especially with performing all the CRUD operations throughout each entity. We overcomplicated it way too much in the beginning and even forgot to do the most basic tasks such as setting up unique

indexes, foreign keys, and AUTO\_INCREMENT. It was still all worth our hard work in the end, and we are extremely proud of how far we have gotten with this project. It will prepare us for not just future classes here at OSU, but also for the real world especially if we want to become database administrators. We both enjoyed this class a lot and look forward to learning more about SQL in the future.

## **Project Outline**

Clearwater Arena is a stadium near multiple small towns in the state of Wisconsin that provide world-class entertainment through their venues. It requires a database to store their ticket sales, artists, fan information, and price per ticket. It also keeps track of all of the employees at Clearwater Arena. These employees provide different services to fans such as bartenders, customer service reps, cashiers, and security. It maintains a record of which employees and artists are performing at which concert on a specific date. A database driven website will record all of the sales of Tickets for Fans, Artists, and Employees. Lastly, it categorizes each ticket sold for the purpose of managing ticket sales and quality correctly.

## **Database Outline**

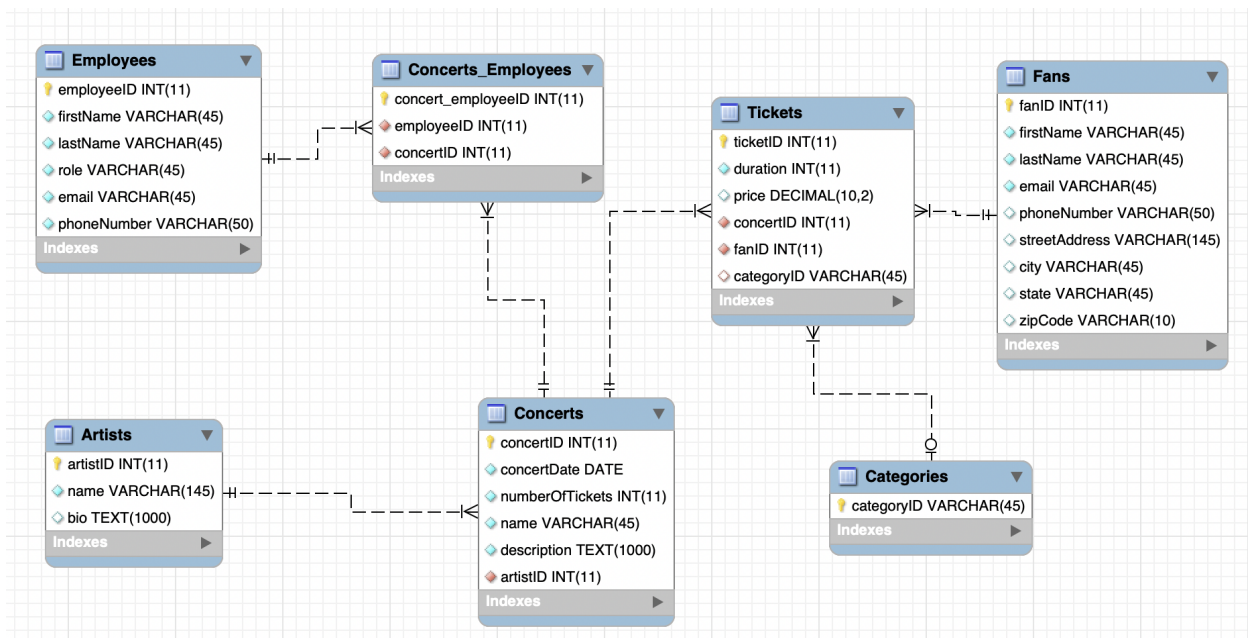

- Fans: Records the details of the accounts of fans who attend concerts at the arena.
  - fanID: int(11), auto\_increment, unique, not NULL, PK
  - firstName: varchar(45), not NULL
  - lastName: varchar(45), not NULL
  - email: varchar(45), not NULL
  - phoneNumber: varchar(50), NULL
  - address: varchar(145), NULL
  - city: varchar(45), NULL
  - state: varchar(45), NULL
  - zipCode: varchar(10), NULL
  - Relationships:
    - A 1:M relationship between Fans and Tickets is implemented with fan\_ID as a foreign key inside of Tickets. One fan may buy a ticket and a ticket can be purchased by multiple fans.
- Employees: Records the details of the accounts of employees who work at the arena.
  - employeeID: int(11), auto\_increment, unique, not NULL, PK
  - firstName: varchar(45), not NULL
  - lastName: varchar(45), not NULL
  - role: varchar(45), not NULL
  - email: varchar(45), not NULL
  - phoneNumber: varchar(50), not NULL
  - Relationships:
    - An M:M relationship between Employees and Concerts is implemented with an intersection table, since one Employee may be responsible for

multiple Concerts, and one Concert may be served by multiple Employees.

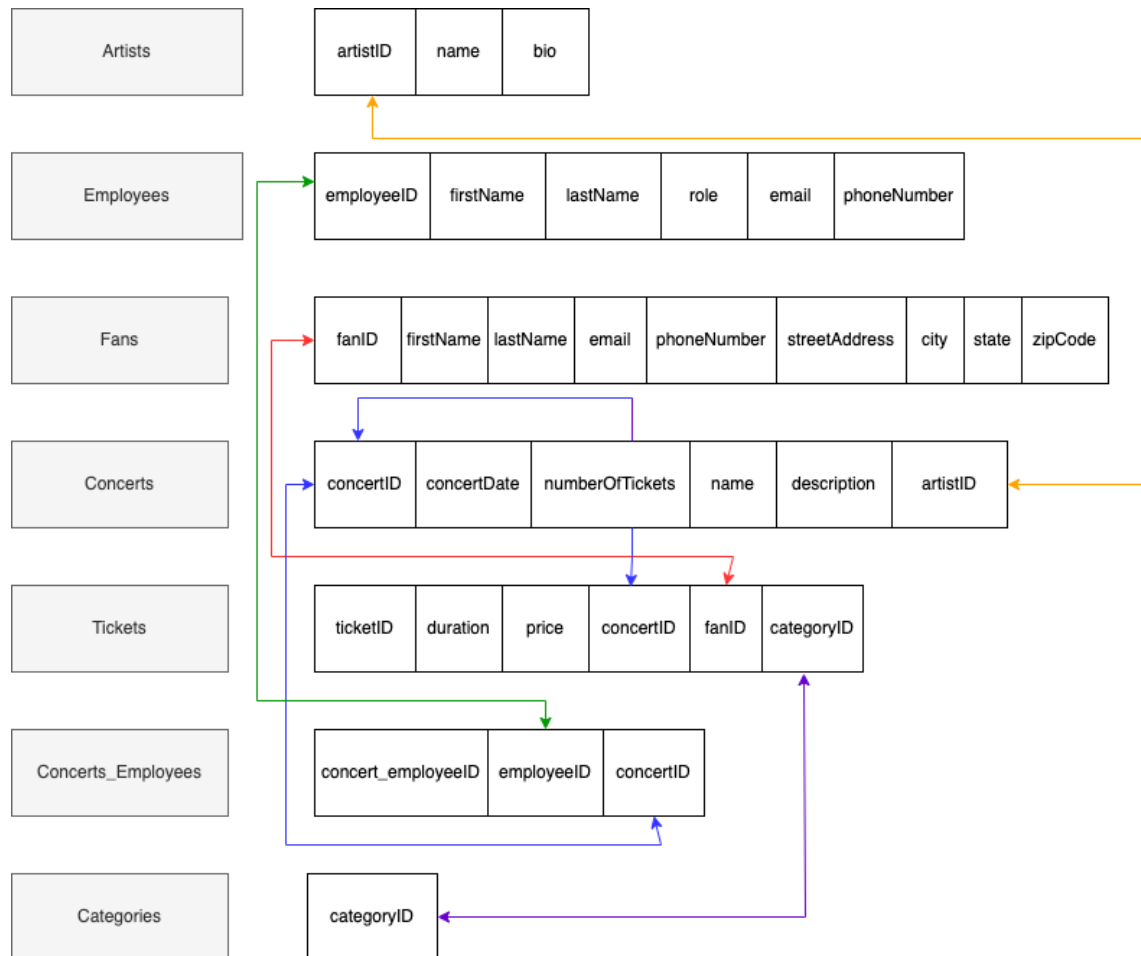

- **Concerts\_Employees:** An intersection table between Employees and Concerts which keeps track of the employees added to each concert.
  - concert\_employeeID: int(11), auto\_increment, unique, not NULL, PK
  - employeeID: int(11), FK
  - concertID: int(11), FK
  - Relationships:
    - An M:M relationship between Employees and Concerts is implemented with Concerts\_Employees serving as the intersection table.
- **Concerts:** Records the details of all concerts at the arena.
  - concertID: int(11), auto\_increment, unique, not NULL, PK
  - concertDate: date, not NULL
  - numberOfTickets: int(11), not NULL
  - name: varchar(45), not NULL
  - description: text(1000), not NULL
  - artistID: int(11), FK
  - Relationships:
    - An M:M relationship exists between Concerts and Employees. A concert can have many employees and an employee can work at multiple concerts.
    - A 1:M relationship between Concerts and Tickets is implemented with concert\_ID as a foreign key inside of Tickets. A ticket may only be for one concert, while a concert may have many tickets.
    - A 1:M relationship exists between Concerts and Artists. A concert may contain only one artist, while an artist may have multiple concerts.
- **Artists:** Records the details of all artists who perform at the arena.
  - artistID: int(11), auto\_increment, unique, not NULL, PK
  - name: varchar(145), not NULL
  - bio: text(1000), NULL
  - Relationships:
    - A 1:M relationship between Artists and Concerts is implemented with artist\_ID as a foreign key inside of Concerts. A concert may have only one artist performing, while an artist may perform at multiple concerts.
- **Tickets:** Records the details for an individual ticket.
  - ticketID: int(11), auto\_increment, unique, not NULL, PK
  - duration: int(11), not NULL
  - price: decimal(10, 2), NULL
  - concertID: int(11), FK
  - fanID: int(11), FK
  - categoryID: varchar(45), FK
  - Relationships:

- A 1:M relationship exists between Tickets and Concerts. A ticket may only be for one concert, while a concert may have many tickets.
- A 1:M relationship exists between Tickets and Fans. A ticket may only be bought by one fan, but a fan can buy multiple tickets.
- A 1:M relationship exists between Tickets and Categories. A ticket may only be categorized as one type, while the categories may apply to multiple tickets.
- Categories: Category table for different types of tickets.
  - categoryID: varchar(45), unique, NULL, PK
  - Relationships:
    - A 1:M relationship between Categories and Tickets is implemented with categoryID as a foreign key inside of Tickets. A ticket may only be categorized as one type, while the categories may apply to multiple tickets.
